                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method of selecting complex as electing modulators of the protein complex; a method of selecting consistency of an interaction between a first protein and a second protein and the treating and/or preventing of diseases and disorders associated with the protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders include cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, inflammatory disorders, sepsis, osteoporosis, obssity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an siRNA oligo which targets the transcript of a protein forming part of a protein-protein complex of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated protein complex having a first protein interacting with a second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sugiyama J, Wettstein DA, Heichman K;

```
The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method for selecting modulators of the protein complex; a method of selecting conclusions of an interaction between a first protein and a second protein complexes and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders associated with the protein complexes. The diseases and disorders include cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsis, osteoporosis, obesity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an siRNA oligo which targets the transcript of a
                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method of selecting comparison of the protein complex; a method of selecting comparison of an interaction between a first protein and a second protein complex and the treating and/or preventing of diseases and disorders associated with the protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders include complexes, and in treating and/or preventing diseases and disorders include cancer, adenomatous polyposis, isolated, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsis, osteoporosis, obesity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an aiRNA oligo which targets the transcript of a coronary and protein-protein complex of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; Vasotropic; Cerebroprotective; Immunosuppressive; Antidiabetic; Cardiant; Neuroprotective; Antidathmatic; Antinflammatory; Antibacterial; Osteopathic; Anorectic; Virucide; Anti-HIV; Nephrotropic; Antiarteriosclerotic; Muscular-Gen.; protein interaction; protein microarray; cancer; familial adenomatous polyposis;
                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated protein complex having a first protein interacting with a second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma.

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises a protein microarray comprises, orderied microarray comprising the protein complex, a method for selecting modulators of the protein complex; a method of selecting modulators of an interaction between a first protein and a second protein; and the treating and/or preventing of diseases and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders associated with the protein complexes. The diseases and disorders cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsis, osteoporosis, obesity, viral infection,
New isolated protein complex having a first protein interacting with a second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma.
                                                                                                                                                                                                                                                                              Disclosure; Fig 62; 198pp; English.

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulators. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acid sem be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects sqainst tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or or thomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                  Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating non-allergic inflammatory diseases, such as psoriasis, eczialergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lession, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osber-Webber Syndrome, myocardial angiogenesis, plaque wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibiting anglogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

                                                                                                                                                                                                      The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating,

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune response is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacyciol dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including carrinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
preventing or ameliorating immune system disorder or tumoral disease e.g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urticaria and atopic dermattits, using an immunostimulatory nucleic acid alone or in combination with other
oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune seaponse is characterised by the proliferation, differentiation, cytokine and antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacytoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipida. As such, these DNA oligos can be used in gene menliorating an immune system discorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating nonallergic inflammatory diseases such as psoriadis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic

The invention relates to the use of one or more splice site-specific primers and optionally one or more arbitrary fragment length polymorphism (AFLP) primers, in a method for analyzing or amplifying a nucleic acid sequence or in the development of ECR primers. The invention also relates to using a PCR primer obtained by the method in the development of an assay, preferably for the analysis of splice sites. The method is useful in analyzing nucleic acid sequences for the presence or absence of splice site-associated polymorphisms. The splice site-specific primers and AFLP primers are useful in genotyping, genetic mapping, genetic profiling and DNA-identification techniques, e.g., to identify a specific species, subspecies, variety, race or individual, to establish the presence or basence of a specific inheritable trait and/or of a gene, or to determine the state of a disease. The splice site-specific primers allow for efficient/exponential amplification. The splice site-specific primers allow for efficient/exponential amplification. The splice site-specific findersprints. The primers have the capacity to target a large population of splice sites present in the genome. This sequence represents a splice-content of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of splice site-specific primers or combination of splice site-
specific primers and arbitrary fragment length polymorphism primer, for
analyzing/amplifying nucleic acid sequence, or in development of PCR-

for

Novel polynucleotide and polypeptide including one or more single nucleotide polymorphisms, useful for diagnosing and treating conditions associated with the presence of sequence polymorphism in humans and animals.

Claim 1; SEQ ID NO 143; 187pp; English.

comprise 217 defined polymorphic sequences. Sequence polymorphism-based analysis of nucleic acid sequences can augment or replace previously known methods for determining the identity and relatedness of individuals. Single nucleotide polymorphisms (SNPs) tend to occur with great frequency throughout the genome and may be located close to loci of interest. Such variations cause or be closely linked to pathological conditions (genetic diseases). Hence the SNPs of the invention may be useful in the development of compounds with cytostatic, imunosuppressive, antihinflammatory, neuroprotective or antimicrobial activities. Regulators of metabolic pathways such as fatty acid metabolism, glycolysis, and amino acid metabolism may also be developed. The compounds may be useful for treating a subject suffering from or at risk for a pathology associated with the presence of a sequence polymorphism. SNP detection is also useful in paternity analysis and correction is also useful in paternity analysis and correction is also useful in paternity analysis and contract application. Polymorphisms may contribute to the phenotype of an order of a pathology associated with the presence of a sequence of an order of the phenotype of the phen organism and phenotypic traits include genetic diseases such as autoimmune diseases, cancer, diseases of the nervous system and infection by pathogenic microorganisms. The present sequence is the sequence surrounding and including a human SNP of the invention. This invention relates to novel isolated nucleotide sequences which

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries may also be used as specialised minic detecting RNA transcripts of a sub-transcriptome under a particular colibraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue colipraries to detect transcripts of a sub-transcriptome under a particular coliponental specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect coliprariants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from trans. In the printed specification, but was obtained in electronic format condition from the printed specification, but was obtained in electronic format colifectly from WIPO at ftp.wipo.int/pub/published_pct_sequences

alysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GBNESEQ files AAQ75547-077798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                             Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Reverse transcription primer used in cDNA analysis technique.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labeled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of

                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEO files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          alysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                           A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AA(75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESGE files ARQ7554-7075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                     by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEO files AAO75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

Non-naturally occuring SCF and C-terminally truncated polypeptides, having amino acid sequences sufficiently duplicative of naturally occuring SCF, stimulate growth of primitive progenitors such as haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The peptides can be used in a composition for treating leucopenia, anaemia or thrombocytopenia, for enhancing engraftment of bone marrow during transplantation or for bone marrow recovery after chemotherapy or transplantation or for bone marrow aplasia or myelosupression. They can also be used for treating neoplasia, nerve damage, infertility, intestinal damage or myeloproliferative disorders. Antibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF
       ğ
double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New stem cell factor polypeptide(s) - for stimulating the growth of primitive progenitor cells, esp. for treating disorders involving blood

amulatication and sequencing of mammalian stem cell factor (SCF). Non-
naturally occuring SCF and C-terminally truncated polypeptides, having
amino acid sequences sufficiently duplicative of naturally courring SCF,
stimulate growth of primitive progenitors such as haematopoietic
progenitor cells, neural stem cells and primordial germ stem cells. The
peptides can be used in a composition for treating leucopenia, anaemia or
thrombocytopenia, for enhancing engraftment of bone marrow during
transplantation or for bone marrow recovery after chemotherapy or
cradiation-induced bone marrow aplasia or myelosuppression. They can also
be used for treating neoplasia, nerve damage, infertility, intestinal
camage or myeloproliferative disorders. Antibodies may be raised against
the peptides for use in detection or neutralisation of SCF in serum. SCF
may be useful for the treatment of AIDS and severe combined
immunodeficiency (SCID) states alone or in combination with other factors
such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                ö

The method comprises: (a) obtaining administration to a subject. The method comprises: (a) obtaining the nemeropoietic progenitor cells from a donor; and (b) expanding the cells by adding to the cells a haematopoietically effective dose of a plypeptide product having at least part of the primary structural confirmation and one or more of the biological properties of naturally cocurring stem cell factor (SCF). The method is useful for stimulating primitive progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, cells which are capable of maturing to erythroid, megakaryocyte, cells which haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful for expanding early haematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplant. SCF is useful for enhancing the efficiency of gene therapy based on transfecting haematopoietic stem cells. SCF is also useful for combating the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence represents a universal

A method has been developed of making haematopoietic cells suitable for administration to a subject. The method comprises: (a) obtaining cadministration to a subject. The method comprises: (a) obtaining be administration to a subject. The method comprises: (a) obtaining the cells confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally confirmation and cells including early haematopoietic progenitor cells which are capable of maturing early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, confirmation to properties cells of both myeloid and lymphoid lineages of increases in haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful for expanding early haematopoietic progenitors in syngenetc, allogeneic confirmation bene maturow transplant. SCF is useful for enhancing the cefliciency of gene therapy based on transfecting haematopoietic stem cells. SCF is also useful for combating the myelosuppressive effects of anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Production of hematopoietic cells suitable for administration to a subject using progenitor cells and expanding the cells using stem cell
oligonucleotide which is used in an example from the present invention

Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polymucleotide into a target mammaland cell in vitro. The method is useful in gene therapy techniques. AAM41301 to AAM41364 and AAB88351 to AAB88390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enhancing efficiency of transfer of polynucleotide into a target mammalian cell in vitro, involves exposing cell that expresses a stem cell factor receptor to stem cell factor, and introducing polynucleotide into cell in vitro.
after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence represents a universal oligonuclectide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                         Stem cell factor; SCF; stem cell factor receptor; blood cell disorder; gene therapy; PCR primer; mutagenesis; probe; ss.

Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AMH41301 to AMH41364 and AAB98351 to AAB98390 represent sequences used in the exemplification of the present

The present sequence for universal PCR primer 220-11 is 1 of 8 universal oligonucleotides (AASO4110-AASO4117) used in the isolation of the human SCF (Stem cell factor) CDNA sequence. The present invention relates to novel stem cell factors (AAU02454) AAU02460, AAU02461) and the collection of the novel stem cell factors (AAU02453-AAU02454). AAU02461) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02462-AAU02481) and the oligonucleotides (AASO4081-AASO4117) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in the isolation of human and rat SCF sequences. The polynucleotide metastatic carcinoma, acute leukaemia, multiple such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple cyeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acids encoding stem cell factor useful for treating disorders involving blood cells, e.g. leukemia, splenomegaly, Hodgkin's disease, Kala azar, anemia and septicemia.
                                                                                                                                                                                                    blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly; anaemia; Kala azar; septicemia; malaria; hypopigmentation disorder;
                                                                                                                                                                                    Human; stem cell factor; SCF; early haematopoietic progenitor cell;
                                                                                                                                                Human SCF (stem cell factor) cDNA universal PCR primer 220-11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.7%; Score 18.4; DB 1; Length 20; 95.0%; Pred. The present sequence for universal PCR primer 220-3 is 1 of 8 universal coligonucleotides (AAS04110-AAS04117) used in the isolation of the human coligonucleotides (AAU02453-AAU02458, AAU02460, AAU02461) and the covel stem cell factors (AAU02453-AAU02458, AAU02460, AAU02461) and the color stem cell factors (AAU02453-AAU02484) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells coloring carly haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02462-AAU02481) and the oligonucleotides (AAS04117) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving Blood cells can melalogize disease, metastatic carcinoma, acute leukaemia, multiple congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, congestive splenomegaly, Rala azar, sarcoidosis, military tuberculosis, alsementated fungus disease, hulminating septicemia, malaria, vitemin Bl2 coloring active carcinomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acids encoding stem cell factor useful for treating disorders involving blood cells, e.g. leukemia, splenomegaly, Hodgkin's disease, Kala azar, anemia and septicemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                               Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar,

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, AIDS and severe combined immunodeficiency (SCID). The present sequence is primer used to amplify an SCF in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful for treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar, sarcoidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; stem cell factor; SCF; early haematopoietic progenitor cell; blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly; anaemia; Kala azar; septicaemia; malaria; hypopigmentation disorder; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence for universal PCR primer 220-3 is 1 of 8 universal oligonucleotides (AAH23888-AAH3895) used in the isolation of the human oligonucleotides (AAH23888-AAH3386) used in the isolation of the human SC SCF fetem cell factor) cDNA sequence. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoletic progenitor cells. The invention also carcibes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73578-AAB73597) and the oligonucleotides (AAB73578-AAB73597) and the oligonucleotides (CAAF23897) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Fulminating septicaemia, malaria, vitamin consideration and folic acid deficiency, pyridoxine deficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                             New stem cell factor polypeptides and their analogs which stimulate growth of early hematopoietic progenitors, useful for treating aplastic anemia, carcinoma, multiple myeloma, vitiligo, kala azar, Hodgkin's

The present sequence for universal PCR primer 220-11 is 1 of 8 universal coligonucleotides (AAH23888-AAH23895) used in the isolation of the human coligonucleotides (AAH23888-AAH23895) used in the isolation of the human correct form call factor) CDNA sequence. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early heematopoietic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB7359) and the oligonucleotides (AAH23899-AAH2389) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in SCF gene threapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive applenomegaly, Kala azar, sarcoidosis, military tuberculosis, congestive planomegaly kala azar, sarcoidosis, military tuberculosis, consentinated fungus disease, Pulminating septicaemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New stem cell factor polypeptides and their analogs which stimulate growth of early hematopoietic progenitors, useful for treating aplastic anemia, carcinoma, multiple myeloma, vitiligo, kala azar, Hodgkin's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, stem cell factor; SCF; early haematopoietic progenitor cell; blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly; anaemia; Kala azar; septicemia; malaria; hypopigmentation disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                     The present sequence for universal PCR primer 220-3 is 1 of 19 PCR primers (AAS10415-AAS10453) used to amplify various portions of the human SCF CNNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polynucles encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma (Gaucher's disease, Niemann-Pick disease, refractory anamia, malaria, vitamin Bl2 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                        Increasing the number of early hematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; stem cell factor; SCF; haematopoietic progenitor cell;

Increasing the number of early hematopoietic progenitor cells in the

```
ö
                                                                                                                                                                                    The present sequence for universal PCR primer 220-11 is 1 of 19 PCR primers (AAS10435-AAS10453) used to amplify various portions of the human SCF cDNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease. Carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, malani, malani, vitamin B12 and folic acid deficiency, hypopigmentation
peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; stem cell factor; SCF protein; leucopaenia; thrombocytopaenia; anaemia; myelosuppression, nerve damage; myeloproliferative disorder; infertility; neoplasia; myelofibrosis; myeloproliferative disorder; metastatic carcinoma; acute leukaemia; multiple myeloma; sarcoidosis; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease; Letterer-Siwe disease; refractory erythroblastic anaemia; Kala azar; Di Guglielmo syndrome; congestive splenomegaly; splenic pancytopaenia; disseminated fungus disease; Fulminating septicaemia; piebaldism; AIDS; acquired immune deficiency syndrome; malaria; military tuberculosis; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; biamond Blackfan anaemia; hypopigmentation disorder; vitiligo; PCR;

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently courtains (SCF) polypeptides having an amino acid sequence sufficiently courtains (SCF) collogical activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, canamia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerved amage in a mammal. SCF sequences are useful for preparing biologically carise polymer polymer polymer polymer polymer polymer polymer polymer in the sequence are useful for preparing biologically active polymer polymer polymer cells with a gene, and transfer of a gene into a mammal. They are useful for treating myelofibrosis, myelosclerosis, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, costeopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, corgestive splenomegaly, Kala azar, sarcoidosis, primary splenomegaly, splenomegaly, kala azar, sarcoidosis, primary splenomegaly, betterer-Siwe disease, refractory explenome, and folicancy vitamin Bloom disorders such as piebaldism, AlDS (acquired immune deficiency, vitamin Bloom of disorders such as piebaldism, AlDS (acquired immune deficiency syndrome) and liting or the present sequence is a PCR primer which is used for an english and an anticipal sequence is a poly primer.
                                                                                                                                                                                                                                                                                                                                                                                         Novel non-naturally-occurring stem cell factor polypeptide, useful for treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         factor (SCF) polypeptides having an amino acid sequence sufficiently duplicative of that of naturally-occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, anaemia and for enhancing bone marrow_recovery in treatment of radiation, or parafement of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal damage, neoplasia, infertility, myeloproliferative disorder, intestinal active polymer polypeptide adduct, for enhancing transfection of early haematopoietic progenitor cells with a gene, and transfer of a gene into a mammal. They are useful for treating myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gancher's disease, lymphoma, Gancher's disease, lymphoma, Gancher's disease, bidemann-bick disease, litterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary splenic pancytopaenia, disseminated fungus disease, malaria, military tuberculosis, Pulminating septicaemia, pyridoxine deficiency, vitamin Bl2 and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation disorders such as piebaldism, AIDS (acquired immune deficiency syndrome) and vitiligo. The present sequence is a PCR primer which is used for amplifying the 5' end of rat SCF CDNA. This sequence is used in the
                                                                                                                                                                              present invention relates to novel non-naturally-occurring stem cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anaemia; myelosuppression; nerve damage; myeloproliferative disorder; infertility; neoplasia; myelofibrosis; myelosclerosis; osteopetrosis; metastatic carcinoma; acute leukaemia; multiple myeloma; sarcoidosis; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease; Letterer-Siwe disease; refractory erythroblastic anaemia; Kala azar; Di Guglielmo syndrome; congestive splenomegaly; splenic pancytopaemia; disseminated fungus disease; Pulminating septicaemia; piebaldism; ADDS; acquired immune deficiency syndrome; malaria; military tuberculosis; pyridoxine deficiency; vitamin BL2 deficiency; folic acid deficiency; bliamond Blackfan anaemia; hypopigmentation disorder; vitiligo; PCR;

                                                                                                                                                                                                                                                                                                                    polynucleotide sequences encoding the SCEs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vittiligo. The present sequence representing a universal oligonucleotide for SCF DNA is used in the examples of the
                                                                                                                                                                                                                           Production of a human stem cell factor (SCF) polypeptide for treating disorders involving blood cells, such as leukemia, comprises culturing mammalian cells comprising non-human SCF promoter DNA linked to DNA encoding the human SCF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to novel stem cell factors (SCFs), polynucleotide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haemaropoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute erythroblastic anaemia, Hodghin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence representing a universal oligonucleotide for SCF DNA is used in the examples of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to stem cell factor (SCF) polypeptides with hematopoietic activity and the polynucleotides encoding them. The polypeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, for improving engraftment of bone marrow transplants, for enhancing bone marrow tecovery after radiotherapy or chemotherapy and in treatment of immune deficiency, neoplasia, nerve demotherapy and in treatment of immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polymucleotides can be used for recombinant expression of the colypeptides and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes.

Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents SCF related DNA of the

The invention relates to stem cell factor (SCF) polypeptides with beematopoietic activity and the polynucleotides encoding them. The polypeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, for improving engraftment of bone marrow transplants, for enhancing bone marrow tecovery after radiotherapy or chemotherapy and in treatment of immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polymetic carcinoma and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents SCF related DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New non-natural stem cell factor, useful for treating e.g. leucopenia or immune deficiency, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 5' or 3' end genomic flanking regions, 5' intrones of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, introcessive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intradron codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention case in antisense gene therapy. The composition of the invention case in antisense gene therapy. The composition may have a comparating the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of continital ammatory steroid in a subject, for reducing levels of adenosine continital ammatory steroid in a subject, for reducing levels of adenosine comparation producing bronchodilation, increasing levels of adenosine contraction in subject is tissue, or treating bronchocomposition, clung surfactant in a subject, stissue, or treating bronchocomposition, clung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this parent is not represented in the printed continity in the subject of a respiratory disease or condition.
                                                                                                                                                                                                                                                             Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding regaion, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory teroid and ubiquinone. A composition of the invention has antiinflammatory and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, ung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO.

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoonstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung alway or lung expression of a target polypeptide associated with lung alway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition composition has antiallergic, antialfammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to increase the degradation of the target mRNA or to pulmonary obstruction, and/or bronchoconstriction and/or lungs. The pulmonary obstruction, and/or bronchoconstriction are associated with a disease or condition such as pulmonary vasoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inflammation, allergies, asthem, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the braskdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

bronchodilating agent

comprising oligonucleotides, effective for alleviating occupance and one comparison describes and composition, alleviating comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, confident depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) adelivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adeling a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition as useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary veasconstriction, and or condition such as pulmonary disease, pulmonary condition replaces, asthma, impeded respiration, respiratory replaced to reduce the manner of the pulmorary inferriors and the manner of the pulmorary inferriors and the manner of the pulmorary inferriors and the pulmorary of the pu invention describes a novel composition (a) a first active agent, 

the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of

to Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 4543; 763pp; English

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The followers of pulmonary obstruction, and/or lung and or available of the larget content or availability or malignant disease. In the lungs of the larget mRNA or to be pulmonary obstruction and/or lung and an entire lungs. inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of ngs.res

The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence repersents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence the contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises an antisense oligonucleotides that are targeted
the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                          Human glucocorticoid receptor-specific antisense oligonucleotide #4234.

The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel intercalator having a specific formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator related DNA 2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navi.3, where the antisense compound a nucleic acid molecule encoding Navi.3, where the antisense compound appecifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathy, trigeminal neuropathy, arthritic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate pain for neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with human Navi.3 expression, the oligonucleotides are designed to target different regions of the human Navi.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; omtidiabetic; microsomal prostaglandin E2 synthase inhibitor; cytoatatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.
                                                                                                       New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to human mpGES-1 gate.

CC human mpGES-1 gene is located on chromosome 9, more specifically to having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 reperfusion injury, or

```

useful for modulating

```
The invention comprises antisense oligonucleotides that are targeted to the nucleic acids encoding a family of human proteins from mitochondrial membranes, which bind insulin sensitising, antidiabetic thiazolodinediones (referred to as mitoNEET). The antisense oligonucleotides of the invention are useful for modulating mitoNEET expression and for treating diseases or conditions associated with mitoNEET, such as diabetes, immunological disorders, cardiovascular disorders including hypertension, neurological disorders, and ischaemia/reperfusion injuries. The present DNA sequence represents a mitoNEET-specific antisense oligonucleotide of the invention. NOTE: The present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a
                                                                                                                                           New antisense oligonucleotides encoding mitoNEET, useful for modulating mitoNEET expression or for treating diseases associated with mitoNEET, e.g. diabetes, immunological disorders or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aplastic anaemia, paroxysmal nocturnal haemoglobinuria; myelofibrosis; myelosclerosis; osteopetrosis; metaeratic carcinoma; acute leukaemia; myelosclerosis; osteopetrosis; metaeratic carcinoma; acute leukaemia; multiple myeloma; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease; Letterer-Siwe disease; coffectory erythroblastic anaemia; Di Guglielmo syndrome; congestive splenomegaly; Kala awar; sarcoidosis; primary splenic pancycopaenia; miliary tuberculosis; primary splenic pancycopaenia; miliary tuberculosis; vitamin Bl2 deficiency; folic acid deficiency; pyridoxine deficiency; vitaming blackfan anaemia; hypopigmentation disorder; piebaldism; vitiligo; neurological damage; infertility; intestinal damage;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises antisense oligonuclectides that are targeted to the nucleic acids encoding a family of human proteins from mitochondrial membranes, which bind insulin sensitising, antidiabetic thiazolodinadiones (referred to as: mitoNEET). The antisense oligonucleotides of the invention are useful for modulating mitoNEET expression and for treating diseases or conditions associated with mitoNEET, such as: diabetes, immunological disorders, cardiovascular disorders including hypertension, neurological disorders, and sischaemia/reperfusion injuries. The present DNA sequence represents a mitoNEET-specific antisense oligonucleotide of the invention. NOTE: The phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; antisense oligonucleotide; mitochondrial membrane; insulna sensitishing antidiabetic thiazolodinediones; mitoNEET; diabetes; immunological disorder; cardiovascular disorder; including hypertension; neurological disorders; ischaemia; reperfusion; ss;
                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides encoding mitoNEET, useful for modulating mitoNEET expression or for treating diseases associated with mitoNEET, e.g. diabetes, immunological disorders or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to preparing a (vertebrate) human stem cell factor (SCP) polyapetide comporting growing host cells transformed or transfected with DNA encoding a human SCF that simulates growth of transfected with DNA encoding a human SCF that simulates growth of transfected with DNA encoding a human SCF that simulates growth of polyapetide produced. Also included is a recombinant host cell cransformed or transfected with an expression control sequence, and isolating the polyapetide produced. Also included is a recombinant host cell cransformed or transfected with an expression control sequence, are retremented SCF polyapetide-encoding DNA operatively linked to a member of the vertebrate SCF polyapetide in the host cell. Instance of other nammals and recombinantly expressed SCF protein frame number of other mammals and recombinant techniques or for generating new and useful viral mannals and recombinant techniques or for generating new and useful viral cransferred prokaryotic and enkaryotic host cells, and new and useful transferred products. The DNA sequences are also useful as labelled probes in isolating human genomic DNA encoding SCF, in methods of probes in isolating human genomic DNA encoding SCF, in methods in developing transgenic mammalian species which may serve as enkaryotic of protein synthesis! In genetic therapy in humans and other mammals, and in developing transgenic mammalian species which may serve as enkaryotic notering proper in solating human genomic DNA encoding SCF, in methods in developing transgenic mammalian species which may serve as enkaryotic suseful for treating heameropoletic disorders, e.g., aplastic anammal, and encoding section of species which may serve as enkaryotic suseful for treating heameropoletic disorders, in developing transgenic and sections. The section of species which may serve as enkaryotic suseful for treating heameropoletic disorders, intenting promessing mannals, milary tuberculosis, milary tuberculosis, prinaman, and prypopigmentation or chemotherapy, an

Preparing a human stem cell factor (SCF) polypeptide, useful for treati hematopoletic disorders, e.g., aplastic anemia, comprises growing host cells transformed or transfected with DNA encoding a human SCF. Suggs SV, Martin FH; Zsebo KM, Bosselman RA, WPI; 2004-497128/47.

(AMGE-) AMGEN INC.

Example 3; SEQ ID NO 32; 210pp; English.

The invention relates to preparing a (vertebrate) human stem cell factor (SCF) polypeptide comprising growing host cells transformed or transfected with DNA encoding a human SCF that stimulates growth of haematopoietic progenitor cells under nutrient conditions, the DNA being operatively linked to an expression control sequence, and isolating the operatively linked to an expression control sequence, and isolating the polypeptide produced. Also included is a recombinant host cell contransformed or transfected with an expression construct comprising a vertebrate SCF polypeptide encoding DNA operatively linked to a correbrate SCF polypeptide in the host cell. Disclosed as new are rat and human nucleic acids encoding SCF, SCF proteins from a number of other mammals and recombinantly expressed SCF proteins from a number of other mammals and recombinant techniques or for generating new and useful considering the large scale synthesis of SCF by a sequences are useful for effecting the large scale synthesis of SCF by a variety of recombinant techniques or for generating new and useful viral and circular plasmid DNA vectors. The DNA sequences are also useful as and circular plasmid DNA vectors. The DNA sequences are also useful as continued growth of such host cells capable of expression of the products of some products. The DNA sequences are also useful as confined probes in isolating human genomic DNA encoding SCF, in methods of production of SCF and SCF products in quantity. The SCF is the net of production of SCF and SCF products in quantity. The SCF is useful for treating hemaniana, myelofibrosis, myelogis, metastatic carcinoma, acute leukaemia, multiple myeloma, carcenoma, acute leukaemia, multiple myeloma, carcenoma, acute leukaemia, multiple myeloma, paccenome of production of such noar acute leukaemia, multiple myeloma, lymphoma, lymphoma, daucher's disease, lymphoma, daucher daucher daucher dauch

syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary splenic pancytopaenia, miliary tuberculosis, disseminated fungus disease, Fulminating septicaemia, malaria, vitamin B 12 and folic acid deficiency, pyridoxine deficiency, Diamond Blackfan annaemia, and hypopigmentation disorders such as piebaldism and vitiligo. The SCF are also useful for reating neurological damage, infertility states, intestinal damage resulting from irradiation or chemotherapy, and AIDS. SCF is also useful for enhancing haematopoietic recovery after acute blood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence is a universal SCF primer used in the isolation of SCF DNA. Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo

The present invention relates to a method (M1) for stimulating proliferation of melanocyte cells in a human. (M1) involves administering a Stem Cell Factor (SCF) protein, or its biologically active fragments that stimulates growth of melanocyte cells, and optionally a carrier, to the human. The SCF is covalently conjugated to a water soluble polymer of the human. The SCF is covalently conjugated to a water soluble polymer of the human. The SCF is covalently conjugated to a water soluble polymer of more other cytckines. SCF is also able to stimulate the growth of primitive progenitors such as early hematopoietic progenitor cells that care capable of maturing to erythroid, megakaryccyte, granulocyte, configurating to erythroid, megakaryccyte, granulocyte, configurating bone marrow regeneration, and in augmenting T cells neural stem cells and primordial germ stem cells (M1) is useful in treating AIDS, configurating bone marrow regeneration, and in augmenting T cell production. (M1) is useful in treating AIDS, aplastic anemia, parcoxysmal nocturnal hemoglobinuria, myelofibrosis, aplastic anemia, parcoxysmal nocturnal hemoglobinuria, cute leukemia, myelostaronia, disseminated fungus disease, fulminating myelosma, Hodgkin's disease, lymphoma, Gaucher's disease, congestive splenomegaly, Kalaacar, sarcoidosis, primary splenic pancytopenia, disseminated fungus disease, fulminating septicemia, malaria, vitamin B12 and folic acid deficiency disease, pridebaldism and vitiligo. (M1) is useful in treating infertility states, intestinal damage resulting from irradiation or chemotherapy, and stem cell myebbaldism and vitiligo. (M1) is useful in treating infertility states, primary thrombocythemia and acute leukemia. (M1) is useful in syngeneic or autologous contents and acute leukemia. (M1) is useful in syngeneic or autologous from primary thrombocythemia and acute leukemia. (M1) is useful in an example from in equipance, is an eleukemia in an example from in enemental marow tangeneic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Martin FH;

Suggs SV,

The present invention relates to a method (M1) for stimulating proliferation of melanocyte cells in a human. (M1) involves administering composition of melanocyte cells in a human. (M1) involves administering to a Stem Cell Factor (SCF) protectain, or its biologically active fragments that stimulates growth of melanocyte cells, and optionally a carrier, to the human. The SCF is covaligated to a water soluble polymer e.g. polyethylene glycol. Also, the SCF is co-administered with one or covare other cytokines. SCF is also able to stimulate the growth of primitive progenitors such as early hematopoietic progenitor cells that are consequent of maturing to erythroid, megakaryocyte, granulocyte, composition of maturing to erythroid, megakaryocyte, granulocyte, composition macrophage cells, and non-hematopoietic stem cells such as neutal stem cells and primordial germ stem cells. (M1) is useful in accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration in functional marrow mass due to toxic, radiant or immunological injury. (M1) is useful in treating AlDS, conjected by a reduction in functional marrow mass due to toxic, radiant or immunological injury. (M1) is useful in treating AlDS, conjecters, osteoperosis, metastatic carcinoma, acute leukemia, mylosic mylosic carcinoma, acute leukemia, conjecters on orgestive splenomegaly, Kalazar, sarcoidosis, primary cylosic pancycopenia, disease, lymphoma cate deficiency disease, and hypopigmentation disorders such as choric myelogenes, conjective pancycopenia, disease, and hypopigmentation deficiency disorders such as choric myelogenia, thrombocythemia and acute leukemia. (M1) is useful in treating infertility states, intestinal damage resulting from irradiation or chemotherapy, and progenitors in syngeneic, allogeneic or autologous cell myelomia and autore leukemia. (M1) is useful in an example from irra Sequence 20 BP; 0 A; 1 C; 1 G; 18 T; 0 U; 0 Other; therapy. The present seque invention for cloning SCF. Universal Stem Cell Factor PCR primer 220-11, SEQ ID 34. 2726

The present invention relates to a method of stimulating growth of stromal cells in a human. The method involves administering to the human at complete and an effective amount of a human stem cell factor (SCP) polypeptide and optionally a pharmaceutically acceptable carrier. The invention is useful for treating immune disorders such as (acquired immune deficiency as niemann pick disease), hematological diseases (such as multiple myeloma, hodgkins disease), neurological diseases (such as multiple myeloma, infection (such as leishmania donovani infection), hypopigmentation disorders (such as plebaldism and vitiligo), in the treatment of infection or chemotherapy and inflammation (such as sarcoidosis). The invention is also useful in gene therapy and SCP therapy. The present control of the an universal PCR primer. This primer is used in the cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Stimulating growth of stromal cells for treating AIDS or severe combined immunodeficiency states in human, primary splenic pancytopenia, miliary tuberculosis, by administering human stem cell factor polypeptide and carrier to human.

```
The present invention relates to a method of stimulating growth of stromal cells in a human. The method involves administering to the human stromal cells in a human. The method involves administering to the human confidencive amount of a human stem cell factor (SCF) polypeptide and optionally a pharmaceutically acceptable carrier. The invention is useful for treating immune disorders such as (acquired immune deficiency syndrome, severe combined immunodeficiency), genetic disorder (such as niemann pick disease), hedisease, anemia), cancers (such as multiple myeloma, hodgkins disease, spleen disease, anemia), cancers (such as acute infection (such as leishmania donovani infection), hypopigmentation disorders (such as plebaldism and vitiligo), in the treatment of infertility states and for treating intestinal damage resulting from irradiation or chemotherapy and inflammation (such as sarcoidosis). The invention is also useful in gene therapy and SCF therapy. The present sequence is an universal PCR primer. This primer is used in the cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stimulating growth of stromal cells for treating AIDS or severe combined immunodeficiency states in human, primary splenic pancytopenia, miliary tuberculosis, by administering human stem cell factor polypeptide and

The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method comprises using a carbodismide derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid. (M1) is useful for labeling double stranded or single stranded nucleic acid or detecting single nucleotide polymorphisms. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                     Labeling double stranded nucleic acid, involves utilizing carbodiimide derivative for labeling thymine, uracil and guanine, which exists in mismatch region of nucleic acid or unstable region of hydrogen bond of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method comprises using a carbodininde derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid or defecting labeling double stranded or single stranded nucleic acid or detecting single nucleotide polymorphisms. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Labeling double stranded nucleic acid, involves utilizing carbodiimide derivative for labeling thymine, uracil and guanine, which exists in mismatch region of nucleic acid or unstable region of hydrogen bond of
                                                                                                                                                                                                                              Oligonucleotide ODN2 used to illustrate nucleic acid labeling method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ð
                                                                                                                                                                                                                     The invention relates to a purified antibody that is specifically immunoreactive with a stem cell factor (SCF) or SCF receptor. Also described: (1) a hybridoma cell line producing a monoclonal antibody that is specifically immunoreactive with a SCF protein; (2) inhibiting the activity of a mast cell population; (3) decreasing blood cell proliferation, maturation or activity in a in a mammal; (4) decreasing the interaction between a SCF and an SCF receptor in a cell population; (5) treating a mammal having a disorder mediated through the interaction of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF polypeptide, and a pharmaceutically immunoreactive with an SCF comprised and methods are useful for inhibiting the activity of a mast cell population, decreasing the interaction maturation or activity in a in a mammal, decreasing the interaction between a SCF and an SCF receptor in a cell population, and treating a mammal having a clivity of maturation or activity in a in a mammal, decreasing the interaction of SCF with an SCF receptor. The antibody, composition, and methods are useful for treating a mammal having a clistoder mediated through the interaction of SCF with an SCF receptor. The antibody, composition, and methods are useful for treating disorders, cuberculosis, or malaria. The present sequence represents a universal cligonucleotide sequence which can be used as a probe or a PCR primer in the amplification and sequencing of rat and human SCF, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to a purified antibody that is specifically immunoreactive with a stem cell factor (SCF) or SCF receptor. Also described: (1) a hybridoma cell line producing a monoclonal antibody that is specifically immunoreactive with a SCF protein; (2) inhibiting the activity of a mast cell population; (3) decreasing blood cell proliferation, maturation or activity in a in a mammal; (4) decreasing the interaction between a SCF and an SCF receptor in a cell population; (5) treating a mammal having a disorder mediated through the interaction of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF with an SCF receptor; and (6) a pharmaceutical composition comprising an antibody specifically immunoreactive with an SCF antibody and methods are useful for inhibiting the activity of a mast cell population, decreasing blood cell proliferation, maturation or activity in a in a mammal, decreasing the interaction between a SCF and SCF receptor in a cell population, and treating a mammal having a disorder mediated through the interaction of SCF with an SCF receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The antibody, composition, and methods are useful for treating disorders, e.g. hematopoietic disorders such as anemia, leukemia, lymphoma, HIV, tuberculosis, or malaria. The present sequence represents a universal oligonucleotide sequence which can be used as a probe or a PCR primer in the amplification and sequencing of rat and human SCF, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a method (M1) for enhancing hematopoiesis in a human or other subject. (M1) comprises: (a) obtaining hematopoietic content subject. (M1) comprises: (a) obtaining hematopoietic content step (a) by adding to the call a stem cell factor (SCF) obtained in step (a) by adding to the call a stem cell factor (SCF) cobtained in step (a) by adding to the call a stem cell factor (SCF) cobtained in step (b) therefore restoring fragments that stimulate growth of hematopoietic progenitor cells; and (c) administering to the human or other subject hematopoietic progenitor cells and enhancing content subject in the human or other subject and enhancing contents in the human or other subject and enhancing comprises: (a) obtained hematopoietic progenitor cells a method (M2) for expanding hematopoietic progenitor cells at a method comprises: (a) obtained in step (b) therefore restoring hematopoietic progenitor cells as well from a donor; and (b) expanding the cells obtained in step (a) by adding to the cells the comprises: (a) obtained in step (a) by adding to the cells the content subject. (M2) is useful for expanding hematopoietic progenitor cells, where the hematopoietic cells are chosen from stem cells of progenitor cells, where the hematopoietic cells are chosen from stem cell deficiencies such as aplastic anemia, paroxymal coturnal hemoglobinuria, myelofibrosis, myelosclerosis, Gaucher's cilsease, Nuleman-Pick disease, Hodgkin's disease, Kala-azar, sarcoidosis, disease, Mu2) is useful in expanding early hematopoietic progenitors. The conemia, hypopigmentation disorders such as piebaldism and vitiligo, and Albs., and folic acid deficiency, pyridoxine deficiency, piamond blacken squence represente a universal PCR primer for SCPP, which is used in an example from the event in an evament of the event in a universal PCR primer for sequence represente a universal p
                                                                                                                                                                                                                                                                                                                                                                                                                      Enhancing hematopoiesis in human, comprises expanding hematopoietic progenitor cells by adding stem cell factor polypeptide to cells and administering expanded cells to human.

Enhancing hematopoiesis in human, comprises expanding hematopoietic progenitor cells by adding stem cell factor polypeptide to cells and administering expanded cells to human. WPI; 2006-053612/06.

Example 3; SEQ ID NO 34; 213pp; English.

The invention relates to a method (M1) for enhancing hematopoiesis in a human or other subject. (M1) comprises: (a) obtaining hematopoietic continuant or other subject; (b) expanding the cells obtained in step (a) by adding to the cell a stem cell factor (SCF) cobtained in step (a) by adding to the cell a stem cell factor (SCF) cobtained in step (a) by adding to the cell a stem cell factor (SCF) coptained in step (b) to respanded hematopoietic progenitor cells a ministering to the human or other subject the expanded hematopoietic progenitor cells continuated in step (b). Therefore restoring hematopoietis to effect comprises in the human or other subject. Also described is a method (M2) for expanding hematopoietic progenitor cells a method (CC comprises: (a) obtaining hematopoietic progenitor cells a method (CC comprises: (a) obtaining hematopoietic progenitor cells witch a donor; and (b) expanding the cells obtained in step (a) by adding to the cells the SCF polypeptide or its biological active fragments. (M1) is useful for expanding hematopoietic progenitor cells, megakaryocytes and erythroblates. (M2) is useful for expanding hematopoietic progenitor cells, megakaryocytes and erythroblates. (M1) is useful for cells, megakaryocytes and erythroblates. (M1) is useful for treating various stem cell deficiencies such as aplastic anemia, paroxymal cc disseminated fungus disease, Hodghir's disease, Kala-azar, sarcoidosis, disease, Niemann-Pick disease, Hodghir's disease, Mala-azar, sarcoidosis, CC disseminated fungus disease, Hodghir's disease, with an alaria, vitamin Black (M2) is useful in expanding early hematopoietic progenitors in summarces hematopoietic and servanding candedicion disorders such as piebaldism and vitiligo, and canemia, hypopigmentation disorders such as piebaldism and vitiligo, enhances hematopoietic progenitors enhances hematopoietic progenitors enhances hematopoietic proderic propenitor enhances hematopoietic proderic proderic proderic proderic proderic proderic proderic proderic proderic prod enhances hematopolesis by expanding early hematopoletic progenitors. The present sequence represents a universal PCR primer for SCF, which is used in an example from the present invention.

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                 gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     yene expression; reverse transcription; primer; cDNA; restriction enzyme; 89.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel isolated nucleic acid molecule capable of modulating transcription, where the nucleic acid molecule shows at least 80 % sequence identity to a sequence listed in Table 1 of the specification (or its complement). The nucleic acid molecule is useful for identifying promoters comproments, or fragments to modulate transcript levels in plants. The present sequence is that of a plant promoter DNA sequence of the invention (derived from either Arabidopsis thaliana or Oryza sativa, but not clearly stated in the specification) which is claimed as being capable of modulating transcription.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription,

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ilysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GBNESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abablled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis; gene expression; reverse transcription; primer; cDNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                         Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547707598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate

                                                                                                                                                                                                                                                                  Analysis of cDNA and gene expression – by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
